## ***ABSTRACT***

*The application of parenting that is applied by every parent we know is very diverse, in its application parenting parents are considered to have a significant share in increasing the independence of a child, because we know together that for the first time the child gets the education, guidance, training and teaching from their own parents. Based on this, this study aims to determine the condition of parenting, the condition of students' independence attitude and to determine the effect of parenting (X) on students' self-reliance (Y). This research was conducted in grade II elementary school cluster 27 Cibiru sub-district Bandung city, with a total sample of 202. The method used in this study is a quantitative method using simple linear regression analysis. The researcher uses a questionnaire and documentation to collect data then performs a normality test and a data linearity test as a prerequisite for analysis. To answer the problem formulation researchers used a simple linear regression analysis using the SPSS 16 program to facilitate research. The results of this study stated that there was a significant influence between parenting parents on students' independent attitudes. The magnitude of the influence of parenting parents on the attitude of student independence is 22.6%. Based on the above explanation parenting parents have a positive effect on attitudes of student independence. Therefore between the school teachers especially parents must establish good communication so that students have the attitude of independence as expected.*

*Keywords: parenting, parents, attitude of independence.*
